English (C1), Portuguese

ABOUT

Senior frontend and product engineer with experience building product applications, internal tools and the systems behind them. Most of my commercial experience has been with React, TypeScript and JavaScript, while more recently I've been building a native iOS application using Swift and SwiftUI.

Throughout my career, I've worked across the product lifecycle, contributing to product development while also improving the way software gets built. As I took on more responsibility, I found myself increasingly drawn to frontend architecture, developer tooling, workflow automation and engineering practices, with a focus on reducing complexity and making software easier to build, maintain and evolve.

I naturally gravitate towards the recurring friction that slows teams down. Whether that's delivering product features, improving workflows or building internal tools, I enjoy understanding how people work and finding practical ways to make that work simpler.

CORE SKILLS

Frontend & Mobile: React • TypeScript • JavaScript • Swift • SwiftUI

Engineering & Product Development: Frontend Architecture • Application Architecture • API Integration • State Management • Design Systems • Internal Tooling

Quality & Delivery: GitHub • CI/CD • Testing • Release Automation • SonarQube

Developer Experience: GitHub Actions • Azure DevOps • Jenkins • Nx • Vite • XcodeGen • Developer Tooling

Collaboration: Technical Leadership • Cross-functional Collaboration • Mentoring • Technical Documentation

Other: Node.js • REST APIs • Docker • Firebase • SignalR • AWS EC2

PROFESSIONAL EXPERIENCE

Product Engineer & Co-creator | Independent Product Venture

12/2025 – Present

Co-creating Alfred with a backend engineer. The product helps people capture ideas, receive recommendations and turn them into practical plans. I lead development of the native iOS application, sharing responsibility for product direction, application architecture and technical decisions while collaborating closely on backend integration and overall product development. The application has progressed beyond its initial MVP and is currently undergoing private TestFlight validation.

- Led development of the native iOS application from the ground up, delivering the first end-to-end product experience covering onboarding, authentication, recommendations and planning workflows, now undergoing private TestFlight validation.
- Designed the application's layered architecture using MVVM-style presentation, repositories, use cases and dependency injection to keep business logic decoupled, testable and maintainable.

- Worked closely with the backend engineer to shape product workflows, technical decisions and application architecture throughout development.
- Integrated backend services for authentication, real-time updates, deep linking and application state while maintaining clear boundaries between networking, domain logic and presentation.
- Developed reusable, accessible UI components with consistent theming and Dynamic Type support, making the interface easier to build, maintain and evolve.
- Added automated tests across the presentation, domain, data and infrastructure layers, focusing on business logic and application behaviour rather than UI interactions.
- Standardised project configuration, build tooling and repository workflows using XcodeGen and automated verification to improve consistency and maintainability.
- Established an AI-assisted engineering workflow that combines code generation with architectural review, testing and manual verification before changes are accepted.

Tech: Swift • SwiftUI • REST APIs • Firebase • XCTest • XcodeGen

Planned Career Break

11/2024 – 11/2025

Took a planned break from full-time employment after relocating permanently to the UK. During that time I focused on recovery, re-evaluated the direction I wanted my career to take and returned to hands-on product development by building Alfred, a native SwiftUI application.

Senior Frontend Software Engineer | The Signal Group | London, UK

12/2023 – 10/2024

Worked on Signal Ocean, a maritime intelligence platform used by brokers, operators and analysts to monitor global shipping activity. As part of a cross-functional product team, I contributed to the Vessel List area, collaborating with Product, Design, Backend and QA to deliver features within a large React and TypeScript monorepo. One recurring challenge was that creating reusable Vessel List templates required support requests and manual engineering work. We redesigned that workflow into a self-service experience that allowed company administrators to create and manage templates independently.

- Owned the frontend implementation of the Template Admin experience, taking the feature through implementation, testing and production release.
- Implemented role-based template management for a multi-company SaaS platform, separating administrator management capabilities from end-user template consumption.
- Built data-intensive configuration workflows using AG Grid, covering validation, permissions, interaction states and reusable editing behaviours.
- Worked closely with backend engineers on metadata-driven APIs and shared application state to support reusable template configuration across multiple dashboards.
- Developed React and TypeScript features across the Vessel List area and the shared UI component library within a large frontend monorepo.
- Onboarded a frontend engineer to the monorepo, Vessel List architecture and Azure-based development environment.

Tech: React • TypeScript • MobX • OpenLayers • AG Grid • REST APIs • Azure

Frontend Tech Lead | Bally's Interactive | London, UK

11/2022 – 11/2023

Provided technical direction across frontend engineering initiatives focused on code quality, developer experience, onboarding and platform modernization. Collaborated with Product, Technical Architects and engineering teams to improve delivery practices, frontend architecture and engineering standards across multiple products.

- Defined a frontend code-quality standardisation programme covering 13 frameworks, tools and shared libraries, introducing consistent linting, formatting, commit validation, Pull Request automation and static analysis.
- Integrated SonarQube with GitHub Actions and Pull Request decoration, investigating monorepo test-reporting issues affecting quality-gate adoption.
- Mapped dependencies and technical debt across the BMC reward-component architecture, identifying duplicated logic, legacy constraints and reusable abstractions to guide modernization.
- Created a structured onboarding programme covering repositories, architecture, production workflows and developer setup, including automated repository discovery through Confluence.
- Provided technical direction during roadmap planning, refinement and delivery, helping define technical stories, prioritise platform improvements and strengthen engineering governance.

Tech: React • TypeScript • Redux Toolkit • Nx • GitHub Actions • SonarQube • Jenkins • Storybook • Node.js • GitHub Enterprise REST APIs

Senior Frontend Engineer | Gamesys / Bally's Interactive | London, UK

10/2020 – 11/2022

I spent much of this role building the tools that sat behind the product rather than the product itself.

Whenever I noticed engineers or content teams repeatedly solving the same problem, I tried to automate it.

- Built a Node.js tool around the Jira REST API that reduced a promotional content workflow from two or three days to around fifteen minutes.
- Developed reusable tooling around the GitHub Enterprise REST API that removed the need to clone repositories for deployment-related tasks.
- Built internal tools that simplified content generation, deployment, and day-to-day engineering workflows.
- Created onboarding guides, architecture documentation and dependency maps that helped people understand large projects more quickly.
- Supported the team through mentoring, code reviews and production troubleshooting.

Tech: React • JavaScript • Styled-components • Node.js • Redux • GitHub REST API • Jenkins • Jira REST API

Frontend Developer | Gamesys | London, UK

03/2019 – 09/2020

Worked on customer-facing promotional products while gradually becoming more involved in the tooling used by the engineering team.

- Built reusable frontend components and styling foundations that improved consistency across promotional interfaces.
- Built internal tooling that made deployments easier to understand and investigate.
- Developed a reusable Node.js wrapper around the GitHub Enterprise REST API that reduced deployment operations from minutes to seconds by avoiding repository cloning.
- Continued developing React applications while improving the tooling around them.

Tech: React • JavaScript • Redux • Sass • Node.js

Co-founder & Frontend Developer | UNBOX | Brazil

2009 – 2017

Co-developed browser-based e-learning platforms and interactive educational products for client projects, focusing on frontend development, user experience, and collaborative delivery.

- Built and maintained browser-based learning platforms and interactive educational experiences using JavaScript, HTML, CSS, and ActionScript.

- Developed frontend interfaces and custom LMS functionality supporting content delivery, interactive learning workflows, and user engagement.
- Managed and customised Moodle-based learning environments across multiple client projects.
- Worked across frontend implementation, client collaboration, deployment coordination, and product customisation within collaborative delivery teams.

Tech: JavaScript • HTML • CSS • ActionScript • Moodle

EDUCATION

Computer Engineering (incomplete)

2005 – 2010

Positivo University, Brazil

Electronics

1997 – 2000

Federal University of Technology (UTFPR), Brazil
